

What is the difference between Porta-Pak & Biopak?

PORTAPAK is a chemical treatment with a very strong antibacterial and odour control. It will slowly break down the waste and can be dumped in septic tanks but not in large volumes without affecting the performance of the tank.

BIOPAK uses natural enzymes for odour control and breakdown of waste. It has rapid waste breakdown properties. It can be safely emptied into septic tanks and will aid its operation,

What is the difference between RV and Express

RV bags have a larger sachet size of 32 grams & can treat up to 150 Litres of waste .

Express bags have smaller sachets which are 25grams & can treat up to 25Litres of waste

Can RV sachets be used in cassette toilets if its only 25Litres?

Yes, you will just get a stronger dose, more anti-bacterial action and more odour control.
